

SARS-CoV-2 proteins (version 2020.2) in the IUPHAR/BPS Guide to Pharmacology Database

Stephen P.H. Alexander¹, Jonathan K. Ball¹ and Theocharis Tsolieridis¹

1. University of Nottingham, UK

Abstract

Coronaviruses are large, often spherical, enveloped, single-stranded positive-sense RNA viruses, ranging in size from 80–220 nm. Of the four structural proteins encoded in the viral genome, the RNA winds around the highly basic nucleocapsid (N) protein. The three other structural proteins, envelope (E), membrane (M) and spike (S), are transmembrane proteins. The E protein is a small (9–12 kDa) single transmembrane domain protein, which enables virus assembly with the M protein, a larger (23–35 kDa) 3TM protein. Coronaviruses are named for the crown-shaped appearance of the virus due to the large (120+ kDa) S spike 1TM glycoprotein, which forms extended homotrimers. The spike protein binds to the animal host cell by interacting with specific anchoring proteins, typically proteinases, such as [angiotensin-converting enzyme 2](#) or [aminopeptidase N](#). This binding facilitates viral entry into the cell and the release of the genome. Aside from the four structural proteins, the remainder of the genome encodes accessory or non-structural proteins and includes proteinases to cleave the two encoded polyproteins. The remainder of the genome encodes elements for viral replication, assembly and release, as well as proteins which manipulate the host's innate immune system.

Contents

This is a citation summary for SARS-CoV-2 proteins in the [Guide to Pharmacology](#) database (GtoPdb). It exists purely as an adjunct to the database to facilitate the recognition of citations to and from the database by citation analyzers. Readers will almost certainly want to visit the relevant sections of the database which are given here under database links.

GtoPdb is an expert-driven guide to pharmacological targets and the substances that act on them. GtoPdb is a reference work which is most usefully represented as an on-line database. As in any publication this work should be appropriately cited, and the papers it cites should also be recognized. This document provides a citation for the relevant parts of the database, and also provides a reference list for the research cited by those parts.

Please note that the database version for the citations given in GtoPdb are to the most recent preceding version in which the family or its subfamilies and targets were substantially changed. The links below are to the current version. If you need to consult the cited version, rather than the most recent version, please contact the GtoPdb curators.
